EE 529: Data Analytics in ECE, Spring 2024

Overview

An introduction to data analytics covering topics relevant to electrical and computer engineers.

Class information

Instructor:	Aleksandar Dogandžić	Coover 3119
	ald@iastate.edu	Office hours: M W 2–3
Lectures:	M W 4:25–5:45	Coover 1012
TA:	TBA	
	email	Office hour: TBA

Textbook

We will mostly follow our course lecture notes and slides. Supplemental textbooks are [Murphy 2022] (containing Python examples) and [Blum et al. 2020] (mathematically oriented). A good undergraduate-level book with relevant content on clustering, least-squares regression, and classification is [Boyd and Vandenberghe 2018]. Also useful and free: **Jamesetal2023**; [Leskovec et al. 2020]. Programming aspects (ISU free access, code on Github) [Müller and Guido 2016; Raschka et al. 2022].

Prerequisites

Familiarity with linear algebra and coding/programming. EE 322 or equivalent course in probability and random processes. Familiarity with optimization will be a plus.

Syllabus (tentative)

- Math basics, inner product, vectors, matrices,
- Modeling data in high dimensions,
- Regression: linear, logistic,
- Classification: nearest neighbors, SVMs, kernel methods, neural nets,
- Visualization and dimensionality reduction: PCA, clustering, Isomap, MDS,
- Graphs: Random walks, PageRank,
- Big Data: Compressed sensing and matrix completion,
- Introduction to streaming algorithms.

Homework

Homework-problem sets will be handed out during the semester. Problem sets will involve a mix of theory and practical implementation. Theoretical problems may involve a short mathematical derivation, an analysis of a particular data-processing technique, or a construction of a new method. Implementation problems will involve some degree of programming. Feel free to use a scientific programming environment that you are most comfortable with. Python/Matlab/R/Julia will suffice for most problems.

Collaboration policy

You are encouraged to collaborate on homework assignments. However, you must (a) clearly acknowledge your collaborator and (b) compose your final writeup and/or code by yourself. If two assignments are obviously identical, then both will automatically receive a score of zero (0) . Please talk to me in advance for any clarifications.

Course project

The final exam consists of a course project. The goal of the project is open-ended; it can involve either: (a) conducting research on a specific topic of your choice, or (b) coding up a technique and testing it on a real-world dataset, or (c) both. The only requirement is that it should involve (any combination of) analysis, design, or implementation of a data analytics technique.

Projects are conducted in groups of at most two (2). It will be particularly beneficial for you (and the rest of the class) if you can integrate the project with your own research interests. Start thinking of project ideas early and discuss them with me before finalizing. A two-page project proposal will be due on March 25. Project presentations will be carried out during Prep Week. A final report will be due on May 10. More details will be given out in the coming weeks.

Grading policy

The final grade will be calculated on a score of 100 (homework: 60%, project: 40%). No late submissions please!

Student Accommodations

Meet with me if you have a documented disability and anticipate needing accommodations in this course, Please request that a Disability Resources (DR) staff send a Student Academic Accommodation Request (SAAR) form verifying your disability and specifying the accommodations you need. DR is located in Room 1076 of Student Services.
